

Nasiko Track - Create Agent Load Balancing

Setup Guide For each Team member

-<https://docs.google.com/document/d/1GtzAUsLLmIvWhy2mQt88zXUsNBIJXShAIHQ9id0TjzA/edit?tab=t.0>

Create Agent Load Balancing

Problem: When you have multiple instances of the same agent running, requests always go to the first one, not distributed evenly.

What to Build:

Detect when multiple instances of the same agent are running
Implement load balancing strategies: round-robin, least-connections, random
Add health checks to remove unhealthy instances from the pool
Update the router to use load balancing when routing queries
Add monitoring to show distribution of requests across instances

Skills Needed: Python, networking, load balancing concepts
Time Estimate: 10-14 hours
